

The iPhone 16 Pro and 16 Pro Max will increase in size, and this will be the first size update we've had in several years. The iPhone 16 Pro will measure in at 6.3 inches (up from 6.1), while the Pro Max will measure in at 6.9 inches (up from 6.7). The standard iPhone 16 models will have larger display sizes, according to multiple sources. The iPhone 16 Pro will have a display that's 6.27 inches in size (rounded to 6.3), while the iPhone 16 Pro Max is expected to have a display that's 6.85 inches in size (rounded to 6.9).

With the larger display size, the dimensions of the iPhone's body will also increase. Both models are expected to be taller and wider than the iPhone 15 Pro models, and while thickness will remain the same, the weight will increase slightly due to the larger size. Apple could use the dual-ion exchange glass process that it used for the iPhone 15 models for both the iPhone 16 models and the iPhone 16 Pro models. This process gives the rear glass a frosted effect that contrasts with the main frame color.
