

Prior to the launch of new iPhone models, case makers source the leaked dimensions and specifications of the upcoming devices from Apple suppliers. The information is used to make dummy models for creating cases, and because there's a lot of money involved in being the first to come out with a case for a new device, dummy models are often accurate representations of what we can expect to see from new iPhones.

iPhone 16 dummy models [leaked in April](#) give a clear look at the size differences that we can expect from the iPhone 16 lineup. The Pro models are a bit taller and wider, and the standard iPhone 16 models have a redesigned camera cutout that's vertical instead of diagonal for the two-lens camera system of those iPhones. There are few changes to the exterior camera design of the iPhone 16 Pro models, with Apple continuing to use a square camera bump that houses the three lenses.

The side left of the dummy models shows the Action Button across all four models, which is in line with rumors. The right side highlights the new Capture Button, which is flush with the side of the device rather than protruding like the volume and power buttons.
