

“Turkmentelecom” has expanded the range of digital services. The operator offers customers comprehensive solutions in the field of hosting: virtual dedicated servers, physical servers, and colocation services. This was reported by the company’s press service.

The services allow for the efficient hosting of web projects of any scale with full administrative control over software and hardware components. The services are targeted at various market segments. Virtual servers are suitable for hosting government and private websites, news portals, and online stores.

Colocation services are intended for large corporate systems, databases, and mail servers. Physical servers are optimal for high-load web projects, game servers, and business solutions.

Hosting services allow for the management of large databases, video hosting, online cinemas, large media portals, as well as digital banking and telemedicine systems.
