

Nvidia recently launched AI Blueprints, which allow companies to integrate AI agents into their systems. These agents will help perform various tasks—from administrative duties to customer service. Huang predicts that IT teams will need to train these agents, ensuring they align with the “company culture” and “specific job responsibilities.”

Some experts support this idea, predicting that by 2025, 30% of companies will have AI agents as “digital employees.” However, others warn that the transition may take longer as companies assess the effectiveness and reliability of these tools.
