

According to the job listing, Qualcomm is developing platforms based on its Snapdragon SoC processors. These solutions will include not only hardware components but also software, reference materials, and other resources for developers.

Additionally, the company has already created the Qualcomm Data Center team, which is engaged in designing solutions for servers intended for use in data centers. There is speculation that Qualcomm may use high-efficiency cores developed by its Nuvia division for these server solutions. Previously, Nuvia was involved in creating processors for servers and was later acquired by Qualcomm.
