

Huawei will soon unveil a foldable PC, according to Chinese insiders.

Huawei may once again surprise the tech world by presenting its first foldable PC as early as this month, according to leaks from Weibo. The device is expected to run on the HarmonyOS operating system and be powered by a Kirin processor developed by Huawei itself.

The new model is anticipated to debut alongside HarmonyOS PC—Huawei's proprietary operating system designed to replace Windows on its devices. The Kirin PC chip, rumored to be comparable in performance to Apple's M3, is said to use a 7-nanometer manufacturing process. The device's design will likely feature a flexible display.

The launch might take place during a major presentation at the end of May, possibly alongside other products like the Watch Fit 4 Pro. However, the company has not yet confirmed these rumors.
