

The authorities called for accelerating the introduction of AI into the economy and regions of Russia

Russian Deputy Prime Minister Dmitry Grigorenko announced the need to more actively introduce artificial intelligence (AI) technologies in various areas of life of the country. According to him, it is time to move from discussions to real actions so that AI begins to bring tangible benefits to the economy.

During a visit to Novosibirsk, he emphasized that automation and AI allow you to get rid of routine processes, freeing resources and simplifying the work of specialists. This is especially true in the context of rapid technological development.

One of the tasks of the government in this area Grigorenko called the support of regional initiatives and the transfer of successful decisions to the federal level. In his opinion, many subjects are already introducing AI in practice, and now it is important to scale these achievements throughout the country.
