

The insider revealed the appearance of the Galaxy S26 Ultra with a completely new camera design

The popular ICE Universe insider has published a Samsung Galaxy S26 Ultra smartphone concept that reveals the potential appearance of the future flagship.

According to him, the image is based on early information and is not official, but there is a high probability that the final product will look like that.

The main difference from the current Galaxy S25 Ultra is a new layout of the camera block. Instead of separate modules, the three main sensors are now united on an oval substrate, visually similar to the Galaxy Z Fold7 design.

This approach makes the appearance more integral, but increases the protrusion of the cameras, especially taking into account the fact that the device's body will become thinner.

In addition, the insider claims that the main camera and a telecommunications telephoto with a five-time zoom will receive wider Aperture, which should improve the quality of the pictures, especially in conditions of low illumination.

The official presentation of the Galaxy S26 Ultra is expected at the beginning of 2026, but for now, leaks continue to appear that reveal more and more details about the smartphone.
