

Apple is preparing to release the first public beta version of iOS 26-perhaps this week. The final release of the system is expected in the fall, and for now, developers can be the first to test new functions.

In iOS 26 will appear:

- **New** Liquid glass design,
- **Extended** Artificial intelligence (Apple Intelligence),
- **Translation** Messages and calls in real time,
- **Improved** multitasking and much more.

But before installing a beta version, it is worth considering several points:

- **This** The test version, errors, malfunctions and problems with the operation of some applications are possible in it.
- **Better** Install it on an additional iPhone so as not to risk the main one.
- **Necessarily** Make a backup copy of the data.
- **Beta** It can quickly discharge the battery.
- **Temporarily** Avoid entering confidential data - vulnerabilities are possible.
- **Report** About errors through the Feedback Assistant application - this will help improve the system.

The network gave advice before installing the latest iOS 26

- **Come back** The previous IOS version may be complicated.

To install iOS 26, you need an iPhone 11 or newer with iOS 16.5 and at least 20 GB of free memory. First make a backup, then go to the BETA.Apple.com website, log in and register the device. Next, open the settings> Basic> update on> Beta-renewal and select iOS 26 Public Beta.
