

The system for quick digitalization of business was created in Russia

In the press service of the Saratov State Technical University. Yu. A. Gagarin (SSTU) reported that university experts presented a new system of automation of business processes. Development is distinguished by flexibility of settings and ease of integration with popular platforms, including 1C.

As the developer Alexander Konshenko explained, the system allows companies to conduct digital transformation without stopping the main processes. The system includes web and mobile modules, supports electronic document management and automatic formation of commercial offers. A feature of development is the ability to work in an offline mode with subsequent synchronization of data.

The pilot project has already been successfully introduced at an enterprise for the production of ceiling structures. According to the university, the system has proven its effectiveness in real working conditions.

Developers emphasize that an intuitive interface allows you to quickly master a new tool without special training. This makes the solution especially attractive for small and medium-sized businesses.
