

Yandex B2B Tech announced the launch of a neuroanalyst – an agent of artificial intelligence (AI) to visualize data and search for analytical insights. The service will begin to work for external companies in September 2025, but preliminary registration has been opened now.

The neuroanalyst will be built into the Yandex DataLens BI platform in the form of a chat interface. Users will be able to change graphs, adjust the formulas and receive analytical conclusions, simply describing requests in the usual language. According to developers, this will reduce the time of preparation of reports and verification of hypotheses by a third.

The service is not only for analysts. Marketers will be able to quickly test advertising hypotheses, product managers can quickly evaluate the dynamics of sales, and IB specialists-analyze security risks.

Inside Yandex, more than 4 thousand employees have already been tested the tool. For example, the Yandex food team uses it to analyze the courier registration funnels, and Yandex Cloud specialists to prepare research reports.

The neuroanalyst works on the basis of the Yandex Cloud Ai Studio platform, which provides access to generative neuralates and other AI technologies. The solution will be available both in the cloud and for local deployment in corporate networks.
