

Apple Watch Ultra 3, judging by the leak from iOS 26 beta, will get a slightly enlarged display.

The developer Aaron Perris discovered in the fifth beta version of iOS 26 an image associated with a new clock, with a resolution of  $422 \times 514$  pixels. For comparison, the current models of Apple Watch Ultra –  $410 \times 502$ .

None of the Apple Watch version had such a permit, so it can be assumed that Ultra 3 will receive either a slightly larger screen or reduced frame while maintaining the previous case.

It is also possible that an increase in size will allow Apple to place a more capacious battery inside.

Among other expected innovations-support for a satellite communication for messaging, a pressure measurement function, the new LTPO3 OLED display with a more frequent update at ALWAYS-on mode, 5G modem and a new S10 or S11 chip.

The presentation of the Apple Watch Ultra 3 will most likely take place on September 9 – simultaneously with the iPhone 17.
