

The Russian manufacturer of atom electric vehicles is working on the creation of specialized business machines. The company announced the development of modifications intended for use in taxi, car sharing services and for courier delivery needs.

The project is based on a modular platform, which provides ample opportunities for adapting transport. This technology allows in the future to produce cars with various sizes and types of drives. It is planned that the lineup will include both compact city options and larger machines for solving specialized problems.

According to the company representative, the Atom remains open to new ideas.

Earlier at the Taxi International Eurasian Forum in Moscow, the company "Atom" [I presented it](#) Electric car for a taxi. The presented model is designed for four passengers, there will be a three-seater version.
