

Chatgpt has ceased to be exceptional: Grok and Gemini began to catch up with a competitor

The American portal about ZDNET technologies writes that the effect of ChatGPT in the field of generative AI is gradually declining. According to Andreessen Gorovitsa, their company A16z, the neural networks of Google Gemini and the GroK from the XII Ilon Mask are rapidly gaining momentum and approach the market leadership. Competition in this area is intensifying, and Openai positions weaken.

Gemini already ranks second among users of web versions and among mobile devices. The GROK, launched in December 2024, has 20 million active users monthly, and is already in the fourth place, and the number of daily active users increased by 40% after the GROK 4 version is released.

The Google strategy becomes obvious due to the fact that their four products are included in the top 50 applications in the field of generative AI: Gemini, Ai Studio, Notebooklm and Google Labs (No. 39).

Chinese companies engaged in artificial intelligence also demonstrate significant growth. BYTEDANCE QUARK ALIBABA and DUBAO are included in the list of 20 largest web services in the Chinese market, and 22 out of 50 leading mobile AI applications were developed in China, which, according to observers, indicates the expansion of their global influence.
