

DJI will release a compact modular ozmo nano action camera in
September

DJI is preparing a new compact action camera Osmo Nano, which, according to rumors, will become the successor to the 2021 model. It is assumed that the official presentation will take place on September 10.

By leak, the camera is made in modular design. The main block is connected to an additional module with a magnet. On the module, a high-clearing OLED screen is installed, on which you can monitor and control the settings. It also allows you to charge the camera up to 80% in only 20 minutes and contains a SD card slot.

The main block of the camera can be attached from different sides, both in front and behind, with the possibility of a quick change in orientation for selfies, group or filming from the "first person". The volume of internal memory will be 64 or 128 GB.

Particular attention is paid to accessories: fastening on the chest, a lace for wearing under clothing and a blindfold on the head. There will also be an adapter for old accessories of the Action series.

OSMO Nano prices will start at \$ 369/€ 369 per version 64 GB and \$ 399/€ 399 for 128 GB.
