

Google improved the function of editing photos in its Gemini application. The function itself was presented in April, however, the quality of processed images did not correspond to the expectations of users – after editing, the pictures looked unnatural.

According to insiders from Android Authority, after updating, users have the opportunity to change photos so that the objects remain similar to the original. Updated functionality allows you to change people in the photo and change their location, combine several pictures into one, edit photos in several stages and mix styles: for example, you can take one picture in the style of another.

After the photo is taken in the Gemini editor, a watermark from Google will appear on it. It is noted that all innovations are already distributed, and users can already check the Gemini application for updated functions.
