

Google began testing a new function in the Chrome browser, which will increase the confidentiality in the Incognito mode. It will block third -party scripts that use special methods to “render” the user. There are already similar possibilities in other popular browsers – Edge, Firefox and Safari.

The usual mode “Incognito” does not maintain the history of views on the device, but does not completely protect from tracking. Sites and advertising networks can still collect information using third -party scripts. The new function is aimed precisely to close this surveillance channel.

The company has not yet specifying the date of the general launch, but according to media reports, this can happen this year.

True, privacy experts resemble: Chrome remains a Google product, which actively earns on user data. This is not the same “good corporation”.
