

Google published her password manager in Play Store as a separate application

Google has improved its Password Manager Password Built -in Android: in Play Store, this function appeared as a separate application.

According to the Anti-Malware portal, strictly speaking, we are talking about the shortcutting of the functionality of working with passwords, which can be installed as a separate application. The work of the tool remained the same: everything can also be stored and edited by passwords, create TOTP codes and access keys. All data, as before, are automatically updated and synchronized through the Google account, so they are available on different Android devices and in the Chrome browser.

The application icon can be placed on the desktop, on the main screen, which should contribute to convenience and quickly calling the function. But the tool did not receive any fundamentally new opportunities.
