

Google released the final Beta Android 16 before the September release

Google released the Android 16 QPR1 Beta 3.1 update for Pixel beta participants. This is probably the last test release before the release of a stable version scheduled for September 3. The previous Beta 3 came out on July 17.

The new version mainly corrects errors without adding new functions. The update is available for Pixel 6 smartphones and newer, as well as for Pixel Tablet.

Beta 3.1 fixes problems that caused rebooting and freezing the device, including due to Wi-Fi, Bluetooth, calls and some system components. Bugs with missing icons and a search line on the main screen were resolved, an incorrect display of the notifications panel, which disappears media player on the lock screen and visual artifacts after exiting full -screen applications.

Also improved work on folding devices-the fast settings panel are no longer cut, and the status bar is displayed correctly. Fixed errors that lead to failures when updating the system, loading widgets and a set of text.

In addition, sound problems when switching from a voice call to a video call are eliminated, the flights are fixed when connecting a phone to a computer to transfer files and the use of memory is optimized.

Users already registered in the Pixel beta program will receive an update automatically in the near future.
