

Hoverair introduced the new Aqua drone – completely waterproof and capable of working right on the water. This is the first autonomous consumer drone that can be launched and planted to the surface of the water.

The model is focused on lovers: kayaking, surfing, water skis, sailing, etc. Aqua is able to independently monitor a person, developing speeds of up to 55 km/h, and remove from different angles.

The drone is equipped with a camera with a 1/1.3 CMOS matrix, which shoots in 4K and up to 100 frames per second. It is resistant to wind up to 61 km/h and at the same time weighs less than 250 grams.

According to the developers from Zero Zero Robotics, the novelty will become a serious competitor to existing water drones models, offering a more compact, quick and “smart” version.
