

The press service of the Novosibirsk State Technical University (NSTU) reported that university students have created a Telegram Bota to analyze the cryptocurrency market. At the moment, the project is under beta testing, but is already available to the first users.

The developers - Mark Starkchenko and Ilya Zavgorodniy from the Faculty of Business - note that their bot simplifies work with cryptocurrencies. Instead of tracking information on different exchanges and sites, users can receive analytics and forecasts directly in the messenger.

Now the bot is able to track prices, send notifications, analyze risks and conduct a semantic data analysis. In the future, they plan to expand functionality: an analysis of the investment portfolio, risk-modeling and recommendations for its optimization will be added. Also, the bot will be able to track public opinion through the frequency of search queries and use technical indicators.

The official launch of the platform is scheduled for the first quarter of 2026. Then the bot will be transferred from a telegram botto format to a mini-application for Telegram.
