

In Russia, they released children's smart watches with AI assistant
for learning and games

The Russian company AIMOTO introduced Buddygpt's children's smart watches with AI assistant based on Yandex B2B Tech technology. The clock is designed for children of 5-7 years old and combine educational functions with parental control.

The device supports 4G, allows you to call, track the location through GPS and communicate with a smart assistant. AI helps children with home tasks, logical tasks, oral score and tells cognitive stories. The assistant uses Yandexgpt to generate answers and Yandex Speechkit to recognize and synthesize speech.

Built-in filters block undesirable topics and give explanations suitable for children. For example, to the question "Who is more - an elephant or a hippo?" The assistant does not just answer, but offers a detailed explanation with interesting facts. In the "Research World" section, children can learn about space, animals and other topics through mini-lessons and discuss them with a virtual assistant.
