

The iPhone 17 Air will become the most subtle Apple smartphone, but at the same time it will retain almost the same level of computing power as the PRO models.

According to the Fixed Focus Digital insider, the device will receive an A19 Pro chip in a cut configuration - with a core gpu instead of a six -core in the iPhone 17 Pro.

This will achieve high performance in everyday tasks, but in graphically demanding games and when installing video, the difference can be noticeable.

However, the thin case will bring restrictions. It is expected that the iPhone 17 Air will be more prone to Trottling due to worsened heat sink, and will also receive cut functionality: one main camera module instead of three, the lack of Promotion, MMWAVE 5G and stereo-dinosaums.

Despite this, the model can become an engineering achievement if Apple can save a good battery life.
