Since September, in 407 schools in the Moscow Region, the "teacher of the teacher" on the basis of artificial intelligence (AI) will begin to use. This digital assistant is designed to facilitate the teachers with preparation for classes and the creation of individual tasks for students.

The project is implemented thanks to an agreement between the regional government and Sber. Earlier, 250 teachers from 20 schools in Dmitrov and Lobne have already been tested the system. According to the press service of the governor, AISSSTICE works as a methodologist, saving teachers on routine tasks and allowing more attention to pay communication with children.

In addition, in the suburbs they are developing their own "smart assistant to the teacher". He will be able to check manuscript work, find mistakes and even recommend grades. It is expected that the time to test notebooks using artificial intelligence will be reduced by six times.
