

Specialists from MalwareBits recorded a new way of deceit on the Internet. Attackers use special pictures in the expansion .SVG to turn computers of lovers of porn sites into clicks – a tool for invisible interaction with sites.

In this case, hackers force users PC to put likes on their pages on \*Facebook. As the Anti-Malware portal explains when the user clicks on such a .SVG-picture, the browser performs JavaScript, which just likes Facebook.

This code first loads another confusing code, and then starts a malicious program. The program automatically likes target pages without the knowledge of the victim.

Such sites usually work on the WordPress platform. It is noted that Facebook sometimes blocks these pages, but owners of such resources quickly create new accounts and return to their sites.
