

OnePlus 13 received an update with the new Ai Perfect Shot function. This technology is similar to the Google Best Take tool and helps that the name ("best picture") should be made better. She recognizes the faces in the picture and replaces undesirable expressions - for example, blinking or an unscrewed look - more successful.

In addition to the AI Perfect Shot, a soft light filter for portraits and ordinary photos was added in the update. Also now you can export the video in the format of live photos and save them in high quality. A video with a frequency of 120 frames per second retains this speed even after editing. Another convenience is the ability to hide the contents of individual albums from the general list of photographs.

If you have OnePlus 13, check if the update is available.
