

On the eve of the day before, users in Russia unexpectedly gained access to the Google Gemini neural network, which is not available in the country from the very release. However, the joy was short-lived - already in the morning the service stopped working again.

Gemini is a Google development competing with ChatGPT. With its help, you can conduct dialogs, generate texts, translate, analyze information and create images. And all this worked at night, confirmed by the correspondent of Ferra.ru. Sorry, not for long.

The reasons for the “night window window” are still unknown. Most likely, it was a technical error or internal testing. Google did not give official comments.

Now it remains only to wait.
