

The host of the YouTube channel “The benefits of NET” told which models of Poco smartphones now it makes sense to buy.

**POCO X7 Pro.** This model does not have bypass charging, the old Type-C, a plastic frame, the average vibromotor for 18-19 thousand rubles is better than a smartphone you will definitely not find.

**Little F7 Pro.** He does not support LTPO, ESIM, he also does not have a very fast charging. This is a very cool option, but only at a price of up to 30 thousand rubles.

**Little M7 Pro.** He has a lot of preinstalled advertising applications, there is no super -shit. This is all paid off by the budget cost of a smartphone: 11 thousand rubles.

**Little X7.** It is equipped with an old Type-C, a virtual approach sensor, slow charging, a plastic frame, a mediocre vibro, a weak processor. However, his huge plus is an adequate price tag. You will also receive ESIM and screen-waterfall.

**POCO F6 Pro.** This apparatus has an old Bluetooth, Type-C, there is no way to expand the internal memory, there is no mini-jack, wireless charging. But it can be bought favorably and its power is enough for a long time. If you need shooting, a TV, then Realme 14 Pro Plus will be better, advertising in it is also less. On the other hand, if a good processor is important, it is better to look at Poco.

The benefits of NET

**Little M7.** He has an old Bluetooth chip, a virtual approach sensor, a lot of preinstalled advertising applications, mono-sound, bad vibration motor, no support 5G. But he makes a photo good.

**Little F7 Ultra.** It does not support ESIM, Ltpo, when shooting it discards brightness and overheats, it has an old type of type-C and many other minuses. But this is still an attempt to make a flagship for adequate money. Nevertheless, it costs usually quite expensive: 41-42 thousand rubles, and with customs fees – 46 thousand rubles. At the same time, for 50 thousand you can take a full flagship – Xiaomi 15 or OnePlus 13.

**Little C75.** Of the shortcomings of this smartphone, such as the absence of an IR port, mono-sound, a large chin at the screen, a rocky neckline for a selfie camera, little performance, slow operation of the system and hanging, slow internal memory. This is another ultra -bunch that will be difficult to use if you need not only basic functions.

**PAR X6 for.** He came out 1.5 years ago, but still relevant. Keep in mind that this smartphone does not have a mini-jack, a slot for Microsd, a sensor of proximity, problems with overheating and hanging, a lot of advertising that needs to be turned off poorly. Enough for you X6 Pro for one or two years if you set it up for yourself correctly.

**Little C71.** Included with it you will receive a 15 watts power supply. Of the disadvantages of the device, such as the absence of NFC, IR port, poor operating system, slow charging, lack of normal screen protection, case in the kit, low performance, and monosovement. In general, it is better to treat him as a one -time smartphone, but you will not find a better option for 5 thousand rubles.
