

The authorities of the Krasnodar Territory completed the transition to Russian software. All state institutions of the region are now working on the domestic operating system (OM) and use local office applications.

According to the Department of Informatization and Communications of the region, the transition made it possible to create a more protected environment for data processing. All authorities are connected to a single domain with Russian information protection means.

Since 2022, the region has noted the growth of cyber attacks on state structures. For prompt response in the Krasnodar Territory, a round -the -clock monitoring center was organized.

The department emphasizes that such measures not only increase data security, but also reduce dependence on foreign technologies. The transition to domestic software also contributes to the development of the Russian IT industry.
