

According to information published in the official account of the famous Chinese insider Digital Chat Station on the Weibo social network, Samsung plans to present the new flagship of the Galaxy S26 Pro in the compact size building. In this case, the model will receive a battery with an increased capacity compared to the previous model.

The technical characteristics of the Galaxy S26 PRO include 6.27 "Display and a 4300 mAh display with a capacity of 4300 mAh. This is more than the previous Galaxy S25 model, the battery capacity of which was 4000 mAh.

However, the name Pro does not speak of a certain fundamentally new model, but that it will be the basic model Galaxy S26 instead of which the Pro version, which was not previously part of the Samsung line, will be released. It is also likely that Samsung plans to equip the Galaxy S26 Pro with a new sensor in the main camera module, but specific details have not yet been disclosed.

Digital Chat Station previously talked about this and confirmed again that the new series will present the Galaxy S26 Pro, Galaxy S26 Edge (instead of the Plus model) and Galaxy S26 Ultra (instead of the Ultra model). But it is still unknown how a change in positioning will affect the cost and other parameters of the base model.
