

28% of Android users use cheats in mobile games

According to the survey of the Rustore app store, 28% of the owners of smartphones on Android at least once used cheats in mobile games. The study was conducted in conjunction with the IPSOS COMCON company and covered 4,000 respondents throughout Russia.

The main reason for the use of cheats 35% of respondents called the desire to make the game more fun. For 31%, this is a way to increase interest in the gaming process, and 30% use third-party tools to pass complex levels or saving time.

Most users (60%) said they never resorted to dishonest methods. Of these, 27% fundamentally play honestly, and 23% prefer to overcome difficulties on their own. Only 10% refrain from cheats due to fear of getting an account.

According to experts, despite the prevalence of cheating, most players still choose a “pure” passage, following the idea of developers. The survey covered users aged 18 to 60 years from different cities of Russia, including settlements with a number of less than 100 thousand inhabitants.
