

Truver V50 Ultra Complete: The most powerful robot vacuum cleaner is now in Russia

The Russian market entered the Russian market Truver V50 Ultra Complete. This is one of the most technically saturated models in the market, with a number of features, oriented primarily to domestic animal owners. The device is already available on sale at a price of 149,999 rubles.

The main feature of the V50 Ultra Complete was a record absorption of up to 24,000 Pa – three times higher than most standard models. Such power allows the vacuum cleaner to cope not only with dust and wool, but also with larger pollutants like feed, coffee stakes and small garbage. According to the results of tests in the Truver laboratory, the device collected over 94% of the garbage from the carpet for one pass.

The model implements Duosolution™ technology with two separate tanks: one for a universal cleaning solution, the second for a means that eliminates animal smells. The user can highlight the zones in the application where the pets are most often located, and the device will use the appropriate product in these places.

FIND

To maintain hygiene, the vacuum cleaner is equipped with a station that washes mopes with hot water, dries them and processes UV radiation. The level of sterility after processing is up to 99.99%. At the same time, platforms with pugs rise when driving on a carpet and can effectively clean the corners.

The FlexIrise™ navigation system with a retractable lidar allows the vacuum cleaner to navigate in space, including under furniture. If necessary, the sensor drops, and the device passes under objects with a height of up to 89.5 mm.

The robot supports management through the application, and is also compatible with voice assistants and smart home platforms. The special mode “Petamians care” activates enhanced cleaning in the right areas and reminds of the replacement of the HEPA filter.
