

Two Russian companies introduced their unmanned robots.

On the forum “Unmanned Systems: Technologies of the Future” two companies, “168 Robotics” and “Autonomics”, showed their new robots. One of the robots is called BRE 3.0, the other is Pixel.

Bro 3.0 is able to autonomously find garbage, remove, change the route and return to work. Now the manufacturer is working on the functionality of snow cleaning.

The technical director of 168 Robots Yuri Dollenko said that the use of such unmanned robots can make cleaning more than 20% compared to conventional equipment.

Alina Sinyakina, deputy general director of Autonomy, spoke about the Pixel robot. According to the manager, the robot can work in any weather throughout the year. And already now in Moscow parks more than 20 such robots are operating.
