

Vladimir Putin visited the unique production of Omega-3 capsules in Magadan

During his visit to Magadan, Russian President Vladimir Putin visited the Omega-Si innovation enterprise, engaged in the production of capsules with Omega-3.

The plant was opened in 2023 and specializes in the processing and cleaning of fish oil, as well as in the production of capsules with omega-3 in the form of RTG-reemified triglycerides-a special form of fatty acids specially processed to remove unnecessary impurities, so that they become more convenient for mastering the body. The uniqueness of this enterprise consists in the use of white fish of the Sea of Okhotsk, such as sardine and herring.

The production process consists of two lines. The first line is designed to purify fish oil, which is formed in the production of fish flour. Capsules containing more than 70% omega-3 are made on the second line.
