

Windows 11 will decrease the number of notifications when installing the system

In the last beta version of Windows 11 Microsoft, the operating system installed the installation process. Subsequently, this will eliminate one of the most annoying aspects of the settings, the PCWORLD portal reports.

We are talking about Scoobe-Second Chance Out-OF-BOX Experience. This is a system of additional instructions for installing the OS, which appear at the end of the Windows 11 installation process. These notifications help the user to configure various aspects of the OS before going to the desktop.

The problem of Scoobe is that these instructions can cause irritation and fatigue, as they require many requests. This prevents you from starting to use the computer.

Now Microsoft has united many of these requests and presented them in the form of an interface with one screen. The user sees a list of switches, one by one for each additional function, as well as the "Save the current settings" and "Accept and continue" buttons.

Observers note that this allows the user to miss the Windows loading stage with one mouse click and start working with the computer as soon as possible.
