

Xiaomi released a street 3.5K camera Smart Camera 4C, where the picture improves AI

Xiaomi introduced in China a new smart camera Smart Camera 4c 3.5k with an improved picture and a quick connection. The camera received a 6-megapixel sensor with a resolution of 3200×1800 pixels. It allows you to shoot a bright and clear video even in weak light thanks to built-in artificial intelligence. In very dark conditions, the camera can shoot even a color video.

For the connection, a modern two-band Wi-Fi 6 (2.4 and 5 GHz) with OFDMA technology is used, which accelerates data transfer by about 60% compared to previous standards.

In the cell, an AI-chip is installed for quick and accurate operation of the recognition functions of people and pets, as well as traffic tracking. Safety enhances the MJA1 chip with a high level of protection, data encryption and physical curtain in the lens.

For night shooting, there are eight invisible infrared LEDs. The camera can rotate 360° horizontally and vertically 116° . Memory cards up to 256 GB and connection to NAS are supported.

Smart Camera 4c 3.5k costs about \$ 28 and is already available for pre-order in China. There are no access dates for international markets yet
