

## Yandex new TVs now help you go through games and protect your eyes at night

Yandex launched two new TVs with artificial intelligence (AI) based on the Yaos X platform. The flagship model of the TV station about received a miniled screen with a frequency of update 144 Hz and support for Dolby Vision, MMMC and HDR10, as well as the AI-optimization of the image. A more affordable TV station BASIC uses a QLED panel and is equipped with all the functions of the Yandex voice assistant.

The main feature of the update was the new functions of Alice's voice assistant. Now the assistant can analyze the gameplay and give tips for passing complex levels. For comfortable viewing in the evening, a special night mode has been added, which automatically reduces brightness and adjusts the color scheme.

The TV station about is available in diagonals of 55, 65 and 75 inches, the cost of the device varies from 89,990 to 149,990 rubles. The brightness of the Miniled screen reaches 1300 threads, and the visual image parameters are automatically optimized using built-in artificial intelligence. Sound provides speakers with a total capacity of 30 W and 20 watts subwoofer. The model also supports Zigbee and other connection protocols, so it can act as the center of the smart house.
