

Tomsk State University will receive more than 12 million rubles from the federal budget for the implementation of two acceleration programs. In addition to the updated program “Chemistry, New Materials and Agrobiotekh”, this year the university first launches the program “New Devices and Digital Solutions”, oriented on IT and unmanned technologies.

Within the framework of accelerators, TSU students will be able to master entrepreneurial skills for a year of training and create at least 60 startup projects, which, with successful implementation, can receive grants or investments. Programs are supported by industrial partners, including Toptech, Severstal, Lemz-T, NPC BAS, ICTC and others.

Students of all courses and specialties can participate. The program includes intensive training: market analysis, prototypes, creating business models and acquaintance with the experience of successful entrepreneurs. An important part of the course is work on projects: for each program, at least 30 startups are planned.
