

Recently, stories have become more and more often, where communication with chatbots led to serious consequences-from psychological breakdowns to full-fledged tragedies. Experts believe that adolescents are especially vulnerable. Now Openai intends to strengthen the protection of young users, the media write.

CHATGPT developers announced that they will introduce a notification system for parents. If artificial intelligence notices signs of a strong emotional crisis in a teenager, parents will receive a warning. This will work only on condition that parental and children's accounts are related.

At the same time, parents will be able to control the ChatGPT settings: to limit access to certain functions, for example, to preserve the history of dialogs, and include a "children's mode" for safer communication.

Openai has already presented a plan for 120 days to introduce new functions. A bunch of accounts and basic parental settings will appear in the next month.
