

In Moscow, they launched remote monitoring of cancer patients

In the oncological centers of Moscow, a project began to work on remote observation of patients undergoing chemotherapy. More than 1,600 people are already taking part in it. The new service allows doctors to continuously monitor the well-being of cancer patients between treatment courses.

Patients can regularly fill out questionnaires about their condition in the EMIAS.info mobile application, as well as consult with doctors through telemedicine tricks. The system automatically analyzes the answers and selects those who have serious side effects. The attending physician is obliged to view the results of the survey within one working day.

The data is displayed in a single medical system with color indication of risks. This helps experts quickly respond to deterioration and, if necessary, conduct urgent consultations. Thus, treatment becomes safer and more effective.
