

The host of the Techmo YouTube channel compared the Pixel 7, 8, 9 and 10 for shooting photos, videos and other parameters. Spoiler: The novelty is not in everything better than predecessors.

Pixel 7 had a screen update of 90 Hz, and all subsequent models were already released with 120 Hz. As for the brightness of the screen, it increased each time with the output of the new line: in the Pixel 7 it was 1000 threads, in Pixel 8 - 1400 threads, in the Pixel 9 - 1800 threads, in the Pixel 10 - 2000 threads. Diagonal in all devices 6.3 “, with the exception of Pixel 8 with 6.2”.

In the Pixel 10, the size of the main camera has become almost half as much as the predecessors. But in the daytime you will not notice this difference. Another thing is difficult conditions: in them, the pictures on the 10-ku turn out to be noticeably worse than on 8-ku or 9-ku. You can familiarize yourself with the photo examples below. The same applies to the video: Pixel 10 is inferior in quality to Pixel 8 and 9 even in the daytime.

Conclusion

Pixel 10 made an ambiguous impression on the reviewer. On the one hand, he warmed less, showed himself more powerful, he had magnets for wireless charging, the working hours increased, a TV with high -quality zoom appeared. At the same time, the smartphone has become harder (now it weighs more than 200 g), the main lens was cut, its performance remained at the level of the middle class devices.

If you now have a Pixel 9, then you definitely should not switch to the 10th. It makes sense to choose a novelty, if only your battery is quickly discharged, the smartphone is very hot and there are problems with connecting to the network due to a bad modem. You can also consider the Samsung S25 as an analogue.
