

Realme will still release a smartphone with a 10,000 mAh battery,
but only at the beginning of 2026

Realme confirmed the plans to release a smartphone with a record battery for 10,000 mAh, but it is worth waiting only at the beginning of 2026.

Earlier, the company has already demonstrated a concept with a battery of 15,000 mAh and a record energy density of $1200 \text{ W} \cdot \text{h/l}$, and now it is being prepared to bring a more “realistic” solution to the market.

According to insiders, a new model with 10,000 mAh has already passed the stage of mass testing and received a case with a thickness of less than 8.5 mm with a weight of about 215 g. Thus, the smartphone will be comparable to conventional flagships, but will offer the autonomy of the level of “smartphone-Paverbank”.

Realme Vice President Xu Qi hinted that the device could be released in the first quarter of 2026. Earlier, the name Realme GT 1000MAH even appeared on the network, but it is not yet clear whether the company will save this brand.
