

The development strategy of the Far East is aimed at technologicalization and robotization

Preferential regimes in the Far East will be aimed at technological development, robotization and implementation of artificial intelligence, the Eastern Economic Forum reported. This was stated by Deputy Minister for Development of the Far East and Arctic Vitaly Altabaev, writes TASS.

According to him, amendments to the legislation are being prepared, which will allow you to update the development strategy of the region and create a single law on preferential regimes. The working group on prefgrands will receive a new status and will develop the bill in conjunction with the State Duma and the Federation Council.

Altabaev noted successful examples of technology implementation: an automated warehouse complex in Primorye, unmanned aerial vehicles on Sakhalin, fire monitoring systems in the Khabarovsk Territory.

He also spoke about the new project with Cognitive Pilot and the Voskhod Foundation, which will help companies use robots in agriculture.
